

PP Editorial New:
CORTEX: The Connective Tissue of Your Art Universe.

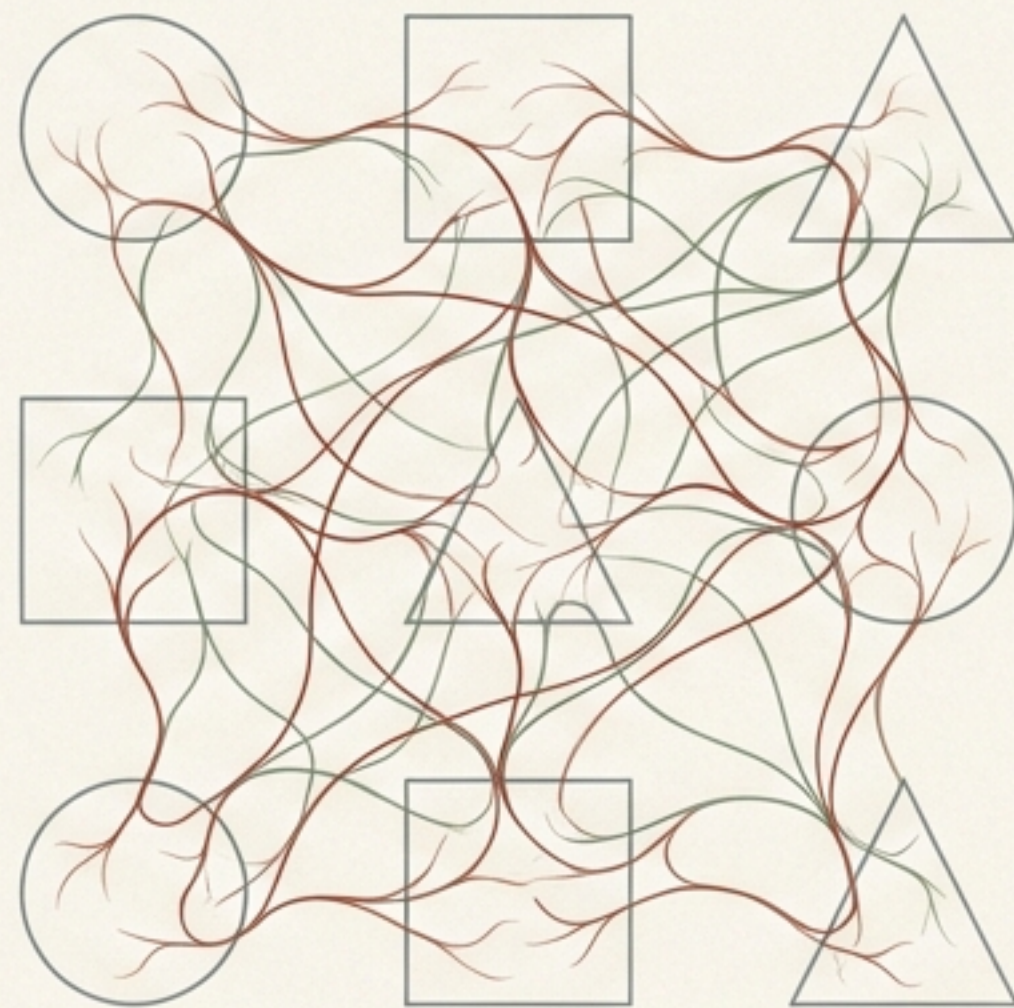

Stop minting isolated pixels. Start building a living on-chain identity.

From Isolated Assets to a Living Network

Every asset you create is a standalone piece of data. Cortex is the on-chain metadata system that wires them together—linking your art, identity, collections, and inspirations permanently in Bitcoin transactions.

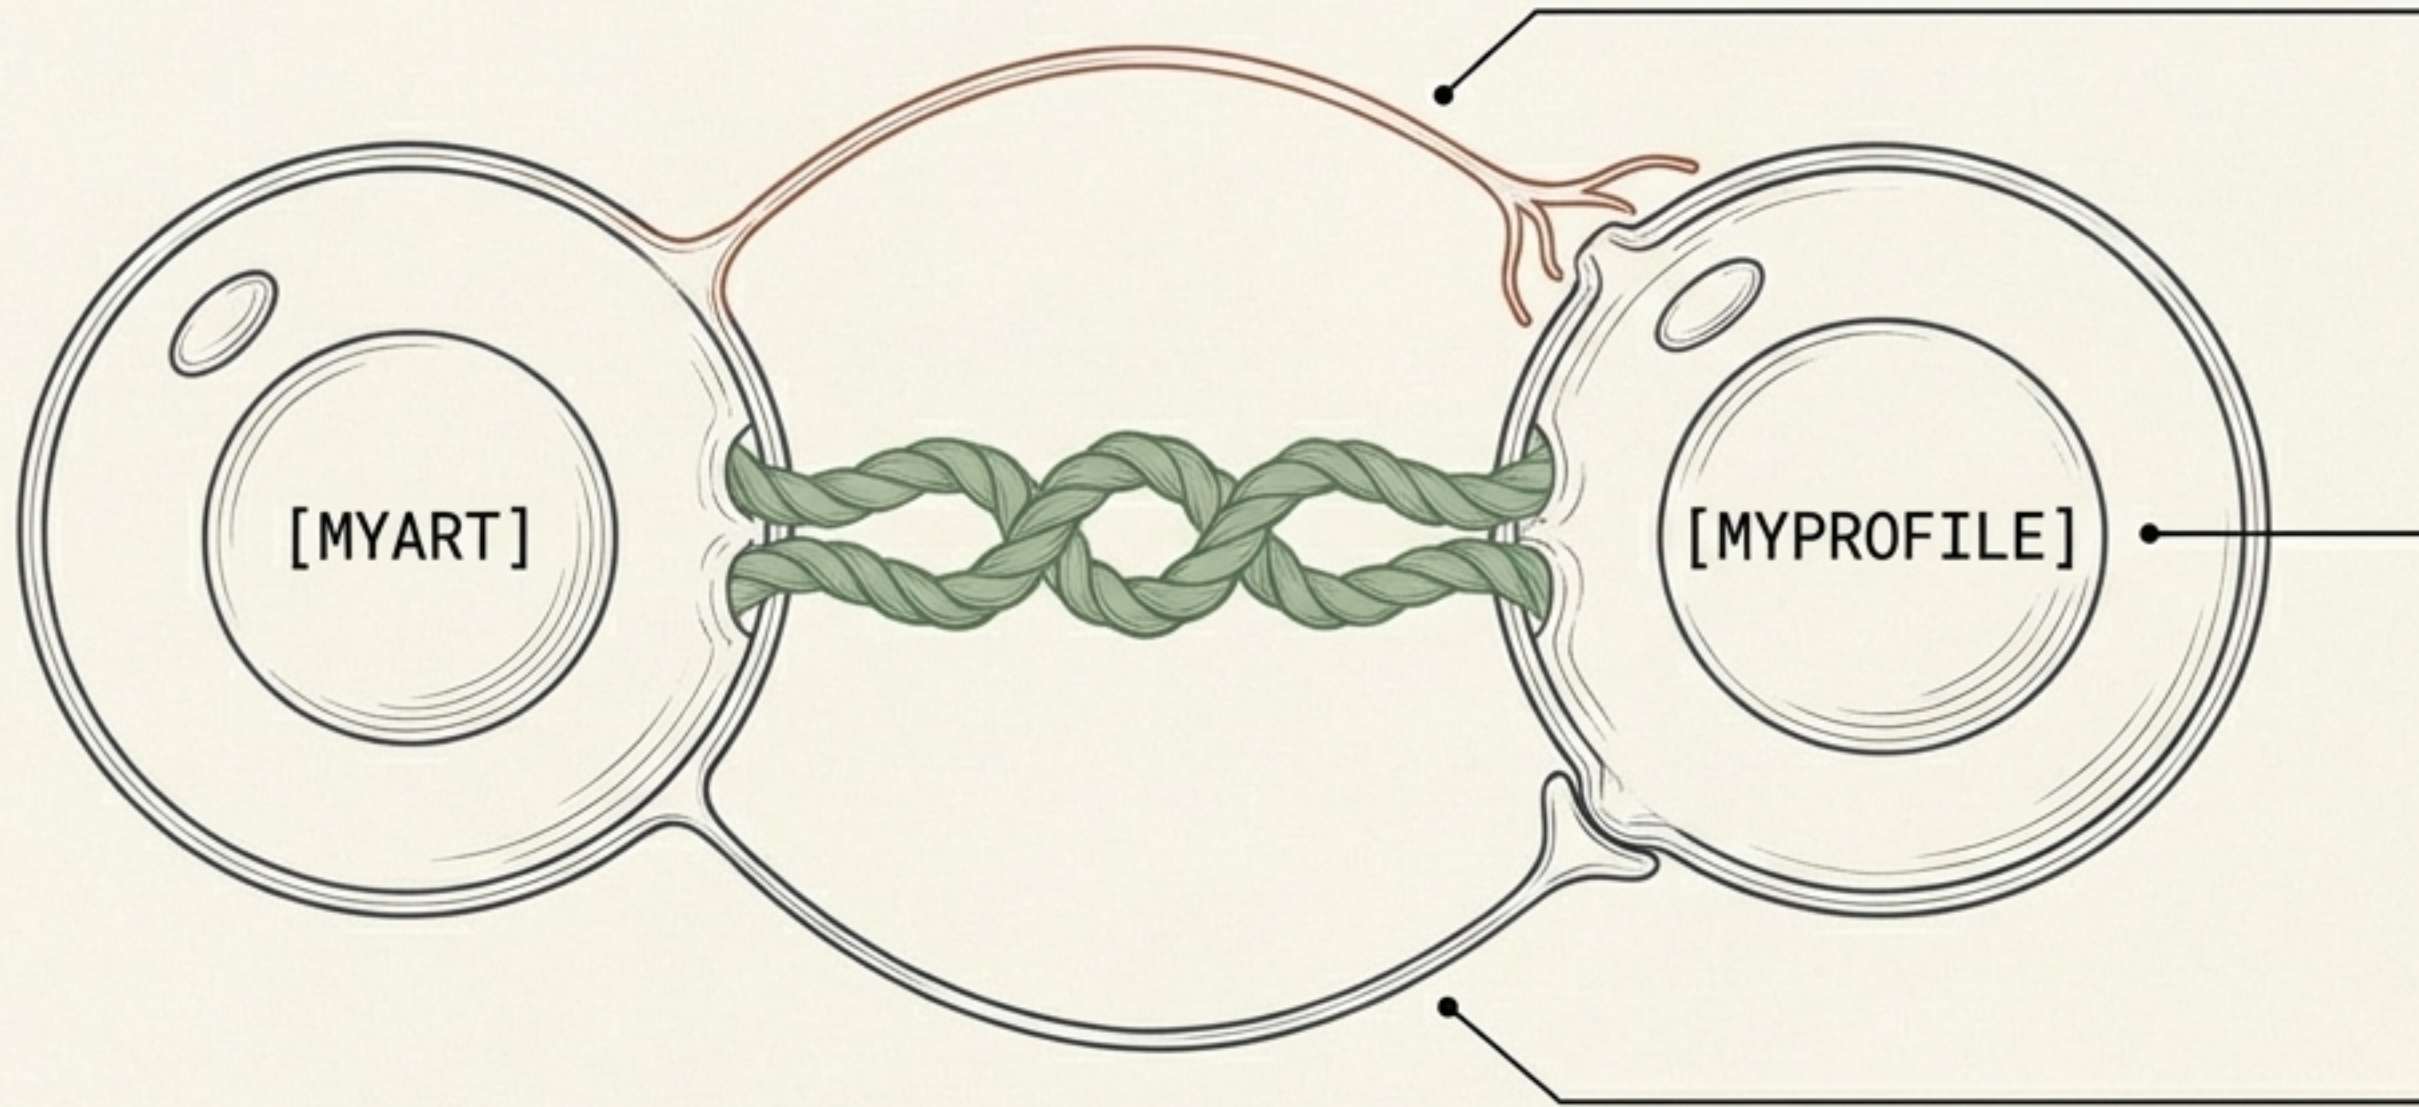

Isolated Architecture

Woven Network

The Anatomy of an On-Chain Connection

Axon (Outgoing):

I made this. A relationship you declare from your asset to a target.

Synapse (The Handshake):

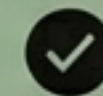

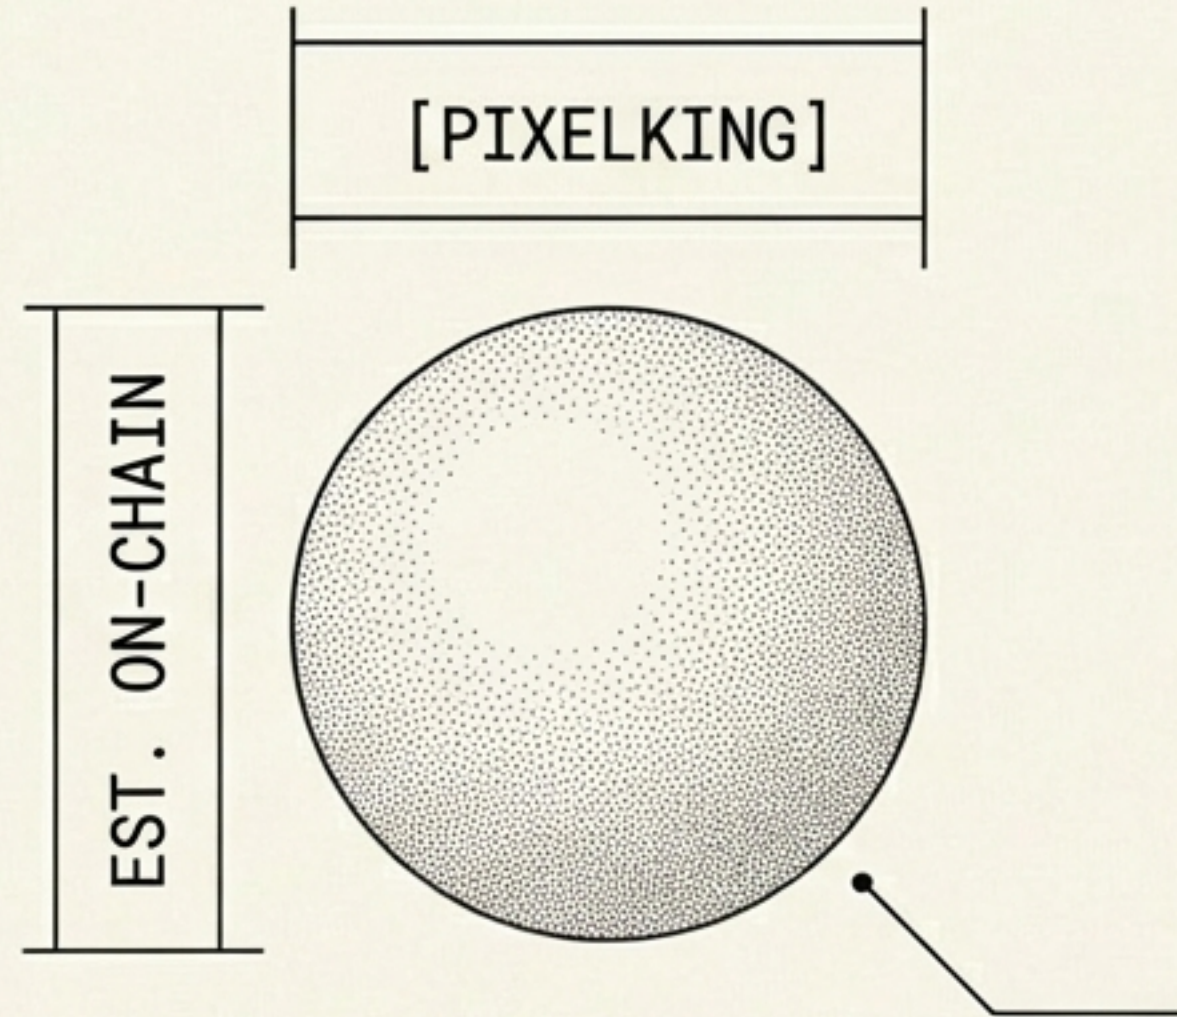

We agree. A confirmed, two-way relationship permanently sealed when both sides independently connect.

Dendrite (Incoming):

This points to me. An incoming reference from someone else's asset.

The Genesis Node: Your Artist Profile

Your permanent on-chain ID (3-16 characters). This is the nucleus of your digital universe. It links everything together for portfolio discovery and provenance.

Auto-Verification

Issue your art from the exact same address as your profile, and Cortex automatically verifies your creations. No manual handshakes required.

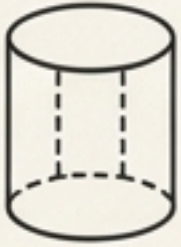

The Art Vault: Architecting Your Storage

OLGA (63 KB)

Native ACME UTXO encoding.

Best for: Pixel art, small on-chain assets.

OP_RETURN (100 KB)

Stored in OP_RETURN outputs. No dust outputs required.

Best for: Medium assets, text, vectors.

Witness (399 KB)

Stored in the taproot witness script.

Best for: Largest native on-chain capacity.

Arweave (Unlimited)

Permanent decentralized permastorage referenced by TxID.

Best for: High-res, 3D, Video.

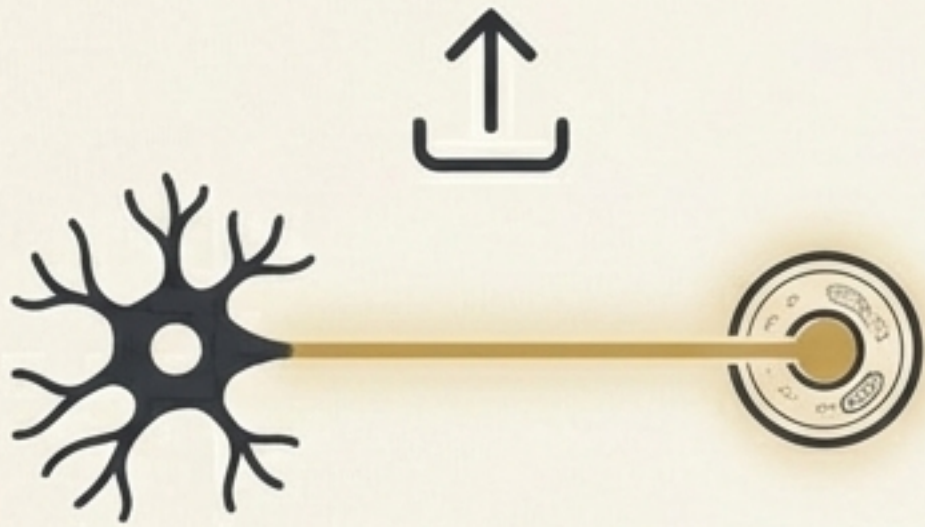

Grouping & Galleries: Forming Collections

Group related works into a series, themed drop, or curated gallery. Any artwork that claims a collection automatically appears as an incoming dendrite on the collection page.

Mechanic: Create the collection and the art from the same address, and the entire gallery is automatically verified on-chain.

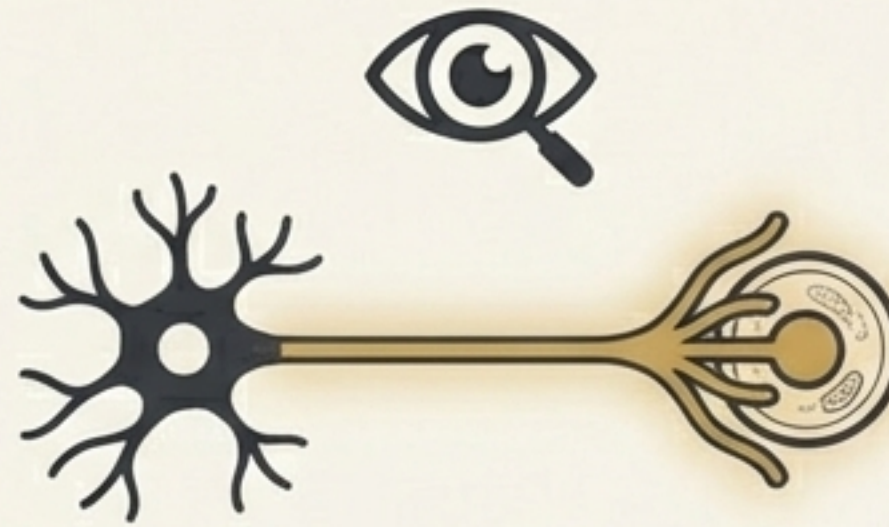

The Curation Engine: The Synapse Approval Flow

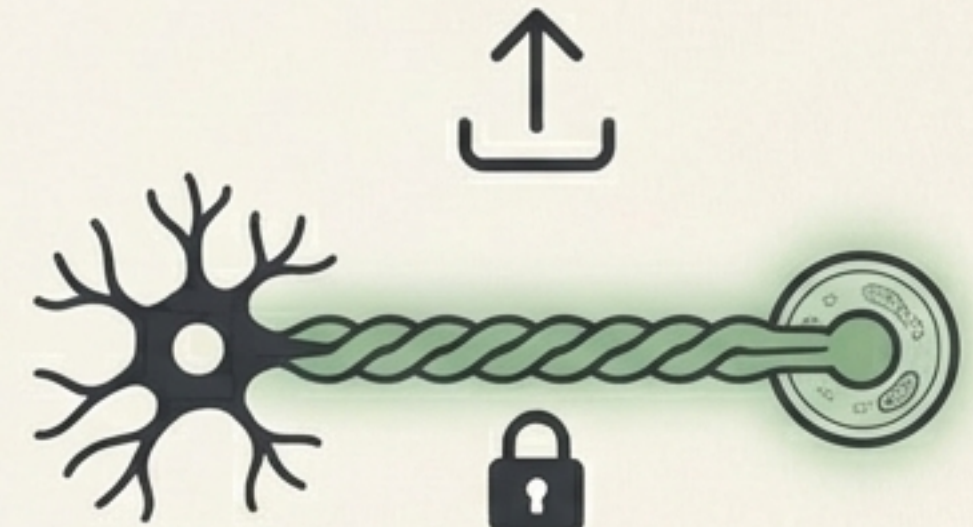

1. Artist Submits

The artwork creates an Axon pointing to the Collection. The status is Pending (Yellow).

2. Curator Reviews

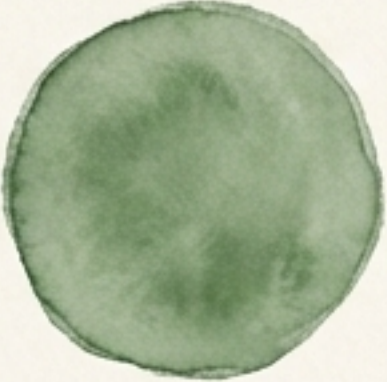

The curator sees the incoming Dendrite on their collection dashboard.

3. Curator Approves

The curator creates a reverse Axon to the art. A Synapse forms, locking the status to Verified (Green).

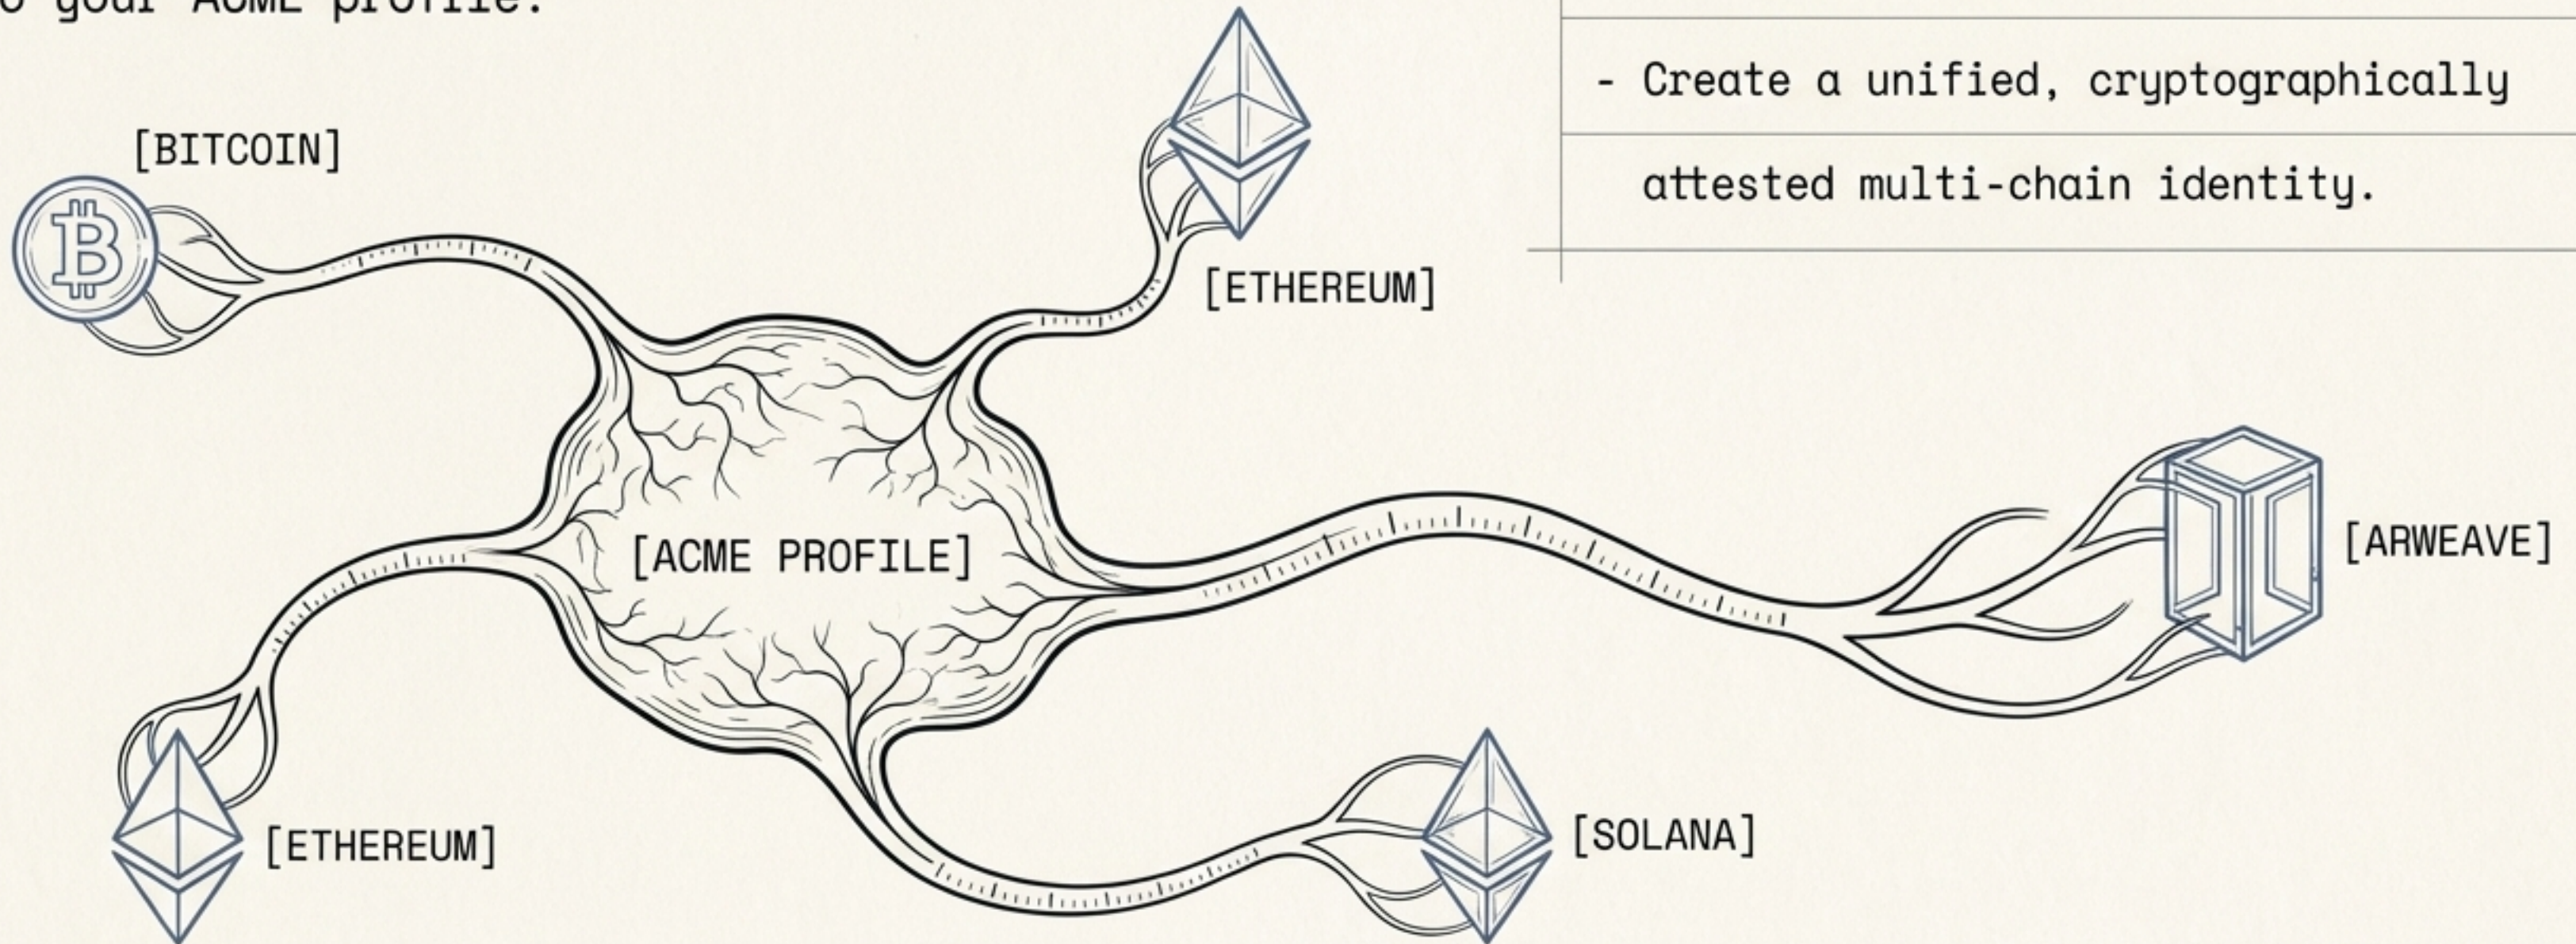

The Trust Spectrum: On-Chain Verification

	Verified Same-issuer verified, or a confirmed two-way Synapse handshake. Absolute, mathematically proven truth.
	Self-Claimed A one-directional claim (e.g., “I belong to this collection”). The relationship is pending and unconfirmed by the target.
	Cross-Chain Points to a foreign blockchain. Remains Gray unless cryptographically signed and attested, which upgrades it to Blue.

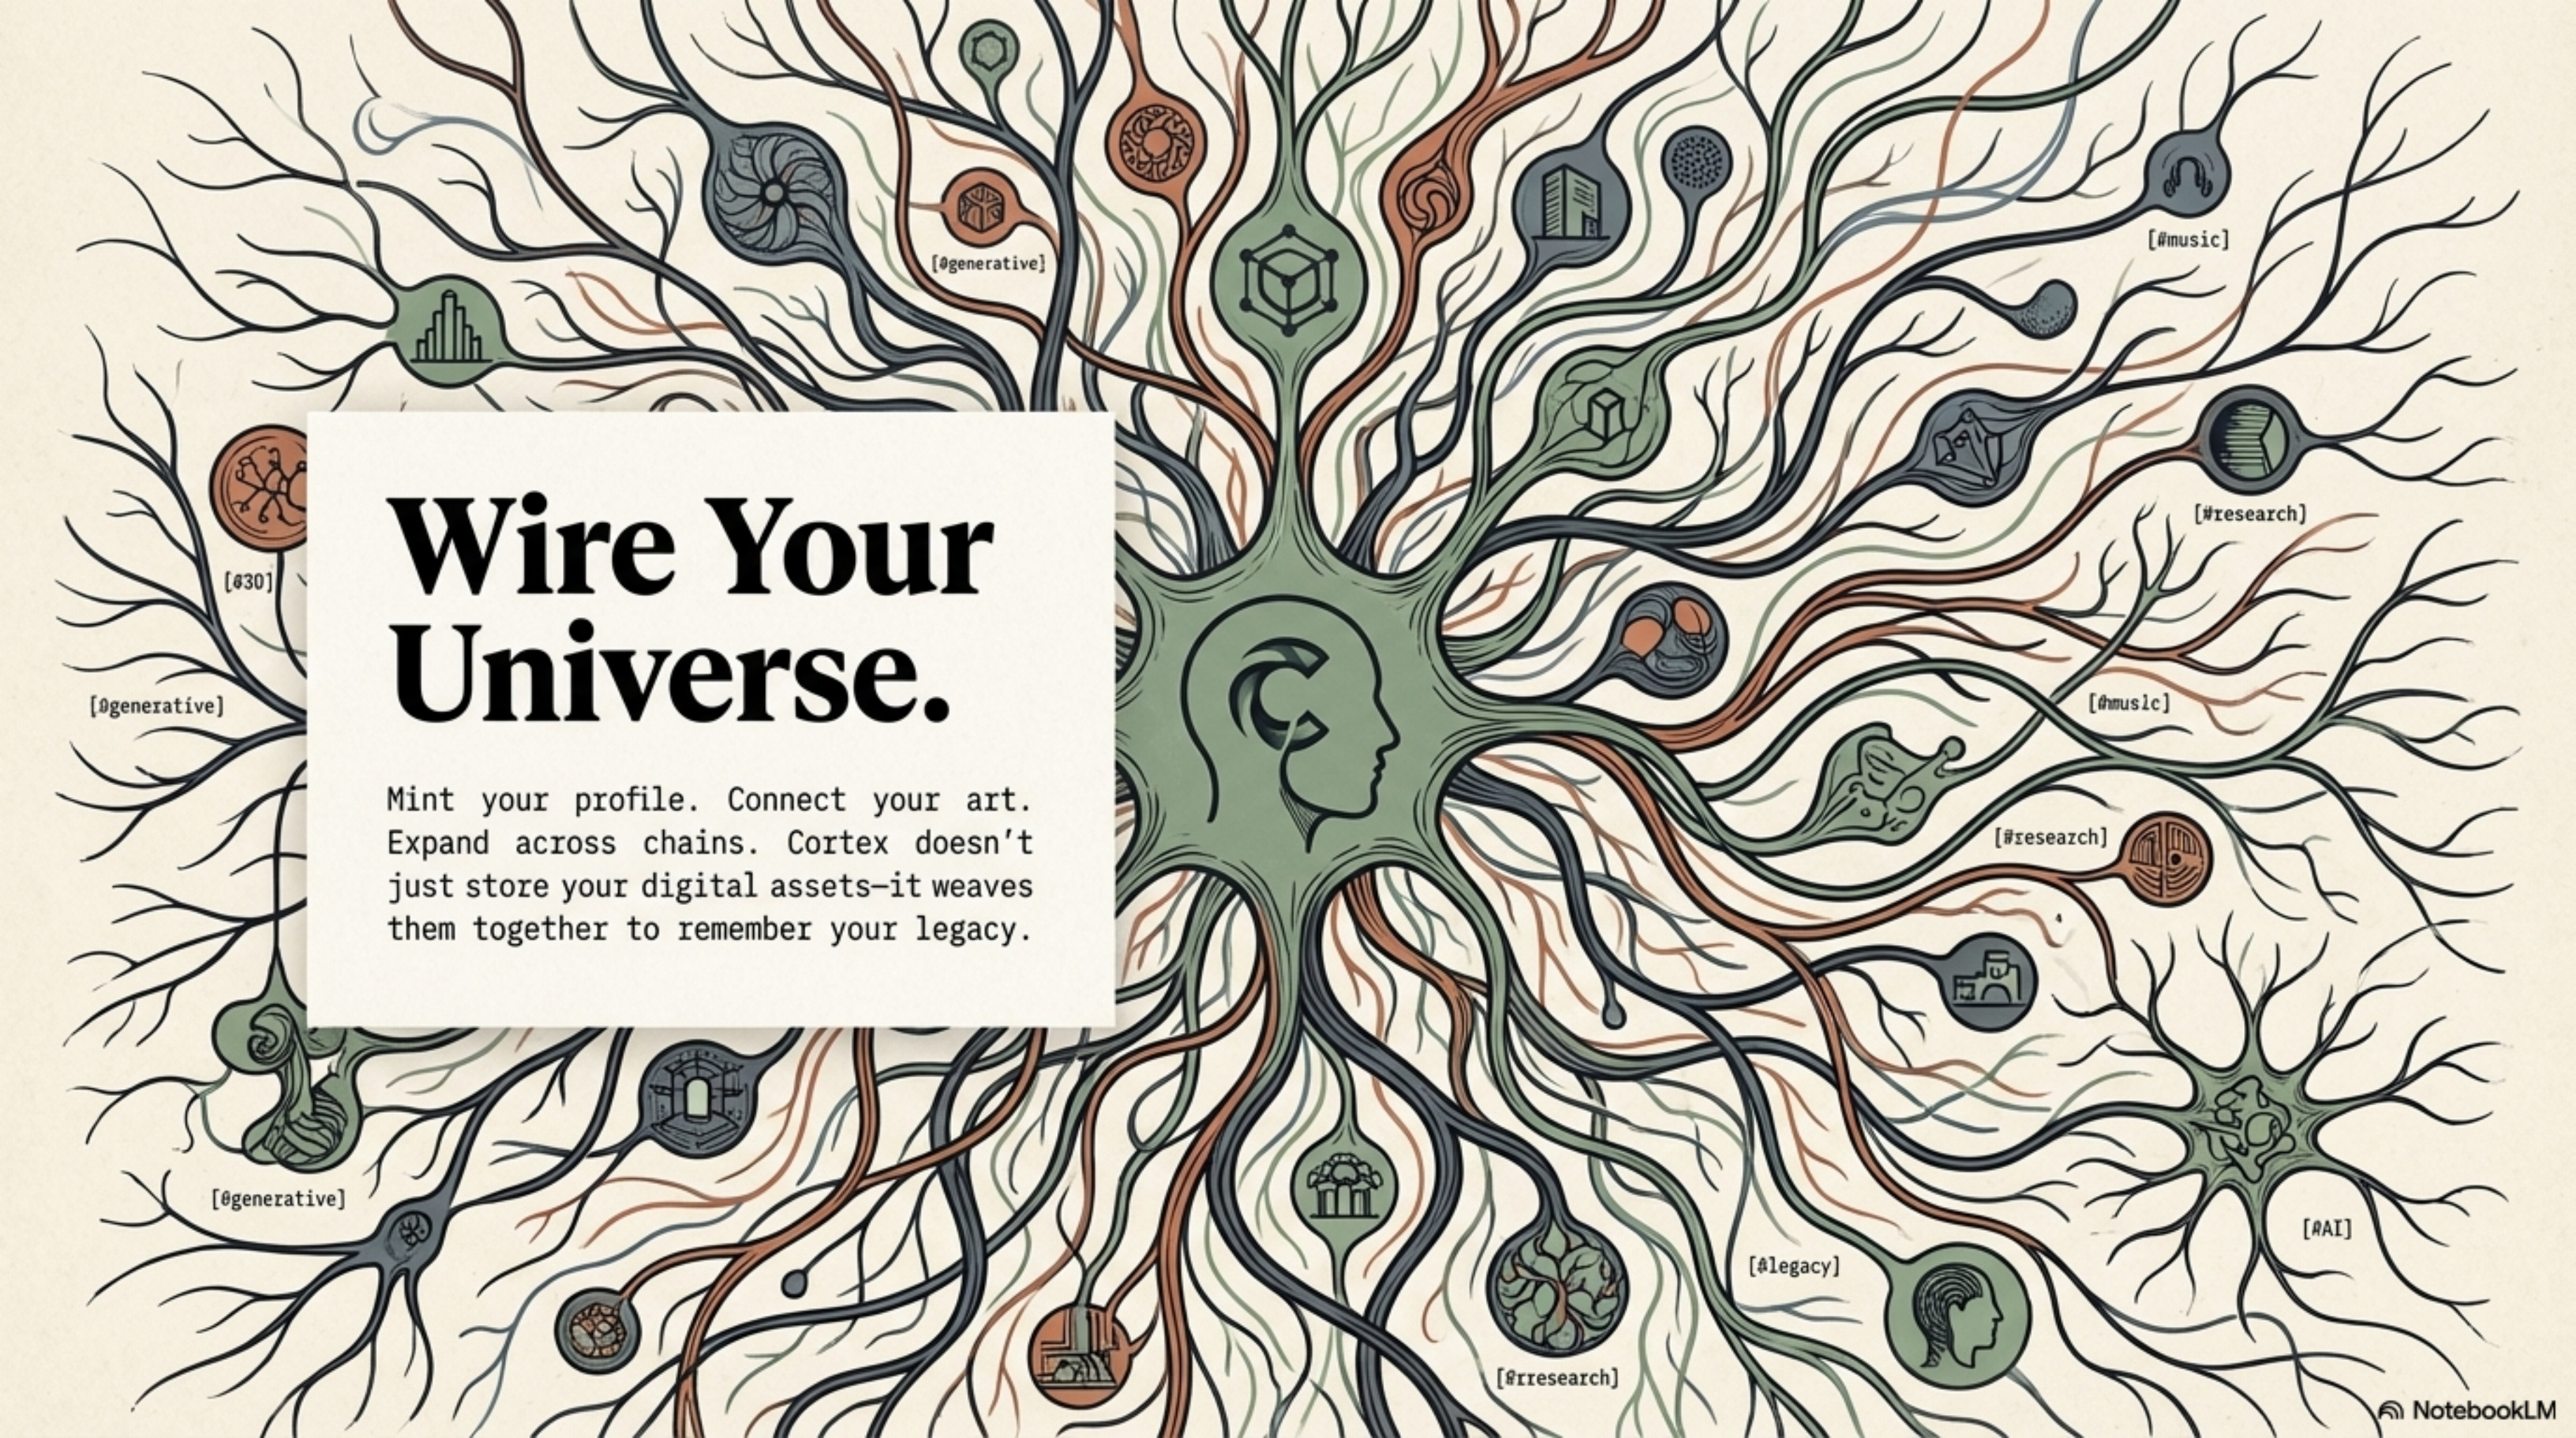

“Expanding the Brain: Cross-Chain Identity”

in PP Editorial New

Your art isn't stuck in one world.
Bind foreign blockchain wallets directly
to your ACME profile.

- Prove ownership of a Bitcoin Ordinal (/o/abc123...i0).
- Link an Ethereum NFT (/eth/0xBC4C.../42) to your native portfolio.
- Create a unified, cryptographically attested multi-chain identity.

Wire Your Universe.

Mint your profile. Connect your art.
Expand across chains. Cortex doesn't
just store your digital assets—it weaves
them together to remember your legacy.
